

14 AI Intake and Request Router

Requests arrive wherever the requester happens to look, then wait in the wrong inbox. This gets them to the right person on arrival.

01 Receive from anywhere

Forms, shared inboxes, chat channels and direct messages

02 Classify the request

Type, urgency and owning department

03 Enrich with context

Requester details and related prior requests attached

04 Check completeness

Incomplete requests are handled before routing

Complete	→	Routed to the owner
Missing information	→	Returned with specific questions
Urgent	→	Escalated past the queue
Duplicate	→	Merged with the existing request

05 Route intelligently

To the right owner or queue, accounting for current workload

06 Acknowledge the requester

Confirmation sent with an expected timeline

07 Track to closure

Open requests visible until resolved

The requester always gets a confirmation, even when the answer is no.

PRIMARY PAYOFF Requests stop landing in the wrong inbox.
